Version 6.4.7

Release Notes · https://support.ontimesuite.com/docs/release-notes-otms/version-6-4-7/

What's New?

Security update

- Security: Strengthened SAML single sign-on security for AD FS and Microsoft Entra ID by improving signature validation, audience validation, and protection against assertion replay. Post-login redirects are now also restricted to approved addresses using REDIRECT_WHITELIST.
  - Upgrade note: Verify that APP_ID_URI matches the application identifier configured in the identity provider before upgrading. It is also recommended to configure REDIRECT_WHITELIST in common.ini to restrict post-login redirects.
- Security: Mitigated CVE-2026-114938, a high-severity vulnerability in the bundled Java runtime that could allow unauthenticated attackers to crash the OnTime service, expose memory, or potentially execute code on affected servers. The installer now disables the vulnerable code on supported processors, both for new installations and upgrades. No user action or configuration changes are required.

Backend

- Updated Apache Tomcat from version 10.1.61 to 10.1.62, including the fixes and improvements from the new release.

Bug Fixes

Backend

- Fixed an issue in Meeting Polls where differences in email address casing could prevent polls from opening or cause the entire poll list to appear empty. Existing polls are also handled correctly.

- Fixed an issue where catering orders on all-day meetings could become stuck in "Event Changed - Please Update Order" status and never reach the canteen for approval. OnTime now prevents catering orders on all-day meetings and displays an error message. Orders on meetings with defined start and end times are unaffected.
- Fixed an issue where integrations using the OnTime API could not retrieve event details when using role-based permissions without "Act on Behalf of" or long EWS event IDs with the calendar owner specified by UserID only.
- Fixed an issue where the OnTime Subscription Hub service could stop when users were added through "Sync N People" in the Admin Center or when their sign-in name was changed in Microsoft Entra ID. This ensures real-time synchronization of Outlook changes continues without interruption.
- Fixed excessive logging of invalid cookie warnings on installations connecting to Exchange Online through EWS, significantly reducing log volume and making relevant warnings and errors easier to identify.
- Fixed an issue on EWS domains where deleting a single occurrence of a recurring meeting from an outdated calendar view could delete the entire series. OnTime now prevents the deletion until the calendar has been refreshed.
- Fixed an issue where attachments on meetings in colleagues' calendars in other domains could not be opened. Attachments can now be opened and are preserved when copying such meetings.
