Version 6.4.6

Release Notes · https://support.ontimesuite.com/docs/release-notes-otms/version-6-4-6/

What's New?

Security update

- Updated the bundled Node.js runtime to **v24.22.1**, which fixes **CVE-2026-111497**.
- **OnTime Room Display was not directly affected by this vulnerability.** We're releasing this update because our policy is to keep the underlying platform current whenever a significant security issue is reported in Node.js.
- No functional changes and no configuration changes are needed.

Backend

- More graceful handling of Microsoft throttling: affected mailboxes are now re-synced automatically outside business hours.
- Improved how incremental sync state is managed across sync runs — full calendar re-syncs now happen only when actually needed, noticeably reducing morning load on installations with push subscriptions.

Bug Fixes

Share My Time

- Fixed an issue where the nightly cleanup could remove Share My Time links that were still valid — including links set to "Use endlessly" and links with pending booking requests. The cleanup now evaluates each link strictly against its own settings.
